

Processor Performance Dashboard

Field Reference Guide · Receiving Department · July 2026

Overview

This dashboard ranks receiving department processors on two dimensions: how much they produce (volume) and how accurately they do it (error rates). It now covers **three error types** — Zone/Pallet destination errors, Split-Move errors, and **SKU Maintenance Incorrect/Incomplete errors** (new). Data is drawn from whichever months have production and error records loaded — the dashboard pulls this dynamically, so the covered date range grows automatically as new months are added rather than being fixed to a specific window.

C-Shift volume figures are scaled by $\times 40/36$ to account for their 36-hour work week (vs 40 hours for A and B), so volume comparisons are fair across all three shifts. Error rates are matched to their relevant denominators — see the Methodology section.

Roster size is not quoted here since it changes as processors join or move shifts — see the TOTAL TMs summary card for the current count.

Navigating the Dashboard

Control	What It Does
Shift tabs ALL / A-SHIFT / B-SHIFT / C-SHIFT	Filters the table to show one shift or the full roster at once.
Column headers (click to sort)	Click any column header to sort by that value, highest first. Click again to reverse. An arrow (↑↓) next to the header name shows the active sort column and direction.
ALL filter	Shows the full roster with no filtering applied.
★ STAR filter (STR ≥ 68)	Shows only top-tier performers — processors with a composite strength score of 68 or above. Use this to identify recognition candidates or study what high performance looks like.
■ COACH filter	Shows processors flagged for coaching attention — those with a zone rate above 3.0 per 10k, a split rate above 15.0 per 100k, or a SKU Maintenance rate above 10.0 per 1,000 (new) . Use this as your quick daily coaching shortlist.

Summary Cards (top of dashboard)

Card	What It Shows
DEPT ZONE RATE	Department-wide zone/pallet error rate (errors per 10,000 placement actions). Benchmark to compare individual rates against.
DEPT SPLIT RATE	Department-wide split-move error rate (errors per 100,000 split-case units). Benchmark for individual split rates.
DEPT SKU RATE	Department-wide SKU Maintenance error rate (errors per 1,000 Capture Item Attribute actions). Benchmark for individual SKU rates.
COACH FLAGS	Count of processors currently flagged for coaching (zone > 3.0, split > 15.0, or SKU > 10.0).
STAR TIER	Count of processors in the top performance tier (composite strength score ≥ 68).

Card	What It Shows
TOTAL TMs	Current roster size for the selected filters — reflects live data, not a fixed headcount.

Color Scale — Error Rate Cells

All three rate columns (ZONE, SPLIT, SKU) use a heat-map color scale, but each uses its own hue family so the three checkpoints stay visually distinguishable: ZONE is green→red, SPLIT is light→dark blue, and SKU is amber→burnt-orange. Within a single column, darker/more saturated always means more severe. The numeric thresholds differ because each rate uses a different denominator and operates at a different natural scale.

ZONE — errors per 10,000 placement actions

Threshold	Rate Range	Meaning
Zero	0.00	No zone or pallet destination errors.
Low	0.01–1.50	Below department average. Performing well.
Moderate	1.51–3.00	Near or slightly above average. Monitor.
Elevated	3.01–5.00	Above average. Coaching conversation warranted.
High	>5.00	Significantly elevated. Priority coaching target.

SPLIT — errors per 100,000 split-case units

Threshold	Rate Range	Meaning
Zero	0.0	No split-move errors.
Low	0.1–4.0	Below department average. Performing well.
Moderate	4.1–10.0	Near or slightly above average. Monitor.
Elevated	10.1–20.0	Above average. Coaching conversation warranted.
High	>20.0	Significantly elevated. Priority coaching target.

SKU — errors per 1,000 Capture Item Attribute actions

Threshold	Rate Range	Meaning
Zero	0.0	No SKU Maintenance Incorrect/Incomplete errors.
Low	0.1–2.0	Below department median. Performing well.
Moderate	2.1–5.0	Near department median. Monitor.
Elevated	5.1–10.0	Above the typical p75 range. Coaching conversation warranted.
High	>10.0	Significantly elevated. Priority coaching target. Matches the COACH filter's SKU threshold.

Note: SKU thresholds were set from the empirical distribution of processors with Capture Item Attribute data (median ≈ 4.8, p75 ≈ 11.6 per 1,000), not from a pre-existing department target. Revisit these breakpoints once a full data window is available.

Row Signals — Left Border & Trend Arrows

Signal	What It Means
Blue left border (star tier)	Processor has a composite strength score of 68 or above. High volume and high accuracy. Recognition candidate.
Red left border (coaching flag)	Processor has a zone rate above 3.0, a split rate above 15.0, or a SKU rate above 10.0. Coaching attention warranted. Matches the COACH filter.
Z▲ green ▼ / red ▲ / gray →	Compares this processor's zone/pallet error rate for the most recently completed month against the month before it. Green ▼ = rate fell (improving). Red ▲ = rate rose (declining — monitor closely). Gray → = no meaningful change.
S▲ arrows (split trend)	Same month-over-month logic as Z▲, applied to the split-move error rate.
K▲ arrows (SKU trend)	Same month-over-month logic as Z▲/S▲, applied to the SKU Maintenance error rate.

Column Reference

Click any column header in the dashboard to sort by that value. Columns marked with a rate are volume-adjusted — higher production does not unfairly increase a processor's error score.

Column	Full Name	Description
TM	Team Member (LanID)	Each processor's unique login identifier. Left border color indicates status (see Row Signals).
STR	Strength Score (0–100)	The single overall performance score. Average of VOL% and ACC%. A score of 68+ is star tier (blue border). The small bar beneath the number visualizes the same score.
VOL%	Volume Percentile (0–100)	How much this processor produces compared to peers, as a percentile rank. C-Shift figures are scaled ×40/36 for the shorter 36-hour work week.
ACC%	Accuracy Percentile (0–100)	How clean their work is compared to peers, ranked 0–100. Now the average of three accuracy percentile ranks — zone, split, and SKU Maintenance (equal weighting) — up from two. Independent of volume.
ZONE	Zone/Pallet Error Rate	Zone destination and palletization errors per 10,000 placement actions. Colored using the ZONE heat scale.
ZPE	Zone/Pallet Error Count	Raw total of zone/pallet errors for the selected period. No volume adjustment.
SPLIT	Split-Move Error Rate	Split-move errors per 100,000 split-case units. Colored using the SPLIT heat scale.
SPE	Split-Move Error Count	Raw total of split-move errors for the selected period. No volume adjustment.
SKU	SKU Maintenance Error Rate	SKU Maintenance Incorrect/Incomplete errors (logged under Checkpoint 1 — Shipment) per 1,000 Capture Item Attribute actions. Colored using the SKU (amber→orange) heat scale.
SKE	SKU Maintenance Error Count	Raw total of SKU Maintenance errors for the selected period. No volume adjustment.
PAL	Units Palletized	Total individual units this processor built onto pallets for the selected period. Raw figure — not scaled for C-Shift hours.
SC UNITS	Split-Case Units	Total individual pieces this processor touched across all task types for the selected period. Raw figure.
CAP	Capture Item Attribute Actions	Total Capture Item Attribute actions for the selected period — the denominator for the SKU rate.
SCANS	Process Scans / Cases	Total cases scanned for the selected period. Since every case should be scanned, this is the minimum number of cases worked.
SH	Shift Badge	Which shift this processor is assigned to. Blue = A-Shift. Purple = B-Shift. Green = C-Shift. Reflects the most recent month on record , so a mid-period shift move (e.g. A→B) now displays correctly instead of showing the earliest shift on file.
Z▲	Zone Rate Trend Arrow	Most recent month vs the month before it. Green ▼ = improving. Red ▲ = declining. Gray → = stable.
S▲	Split Rate Trend Arrow	Same month-over-month logic as Z▲, applied to the split-move rate.

Column	Full Name	Description
K▲	SKU Rate Trend Arrow	Same month-over-month logic as Z▲/S▲, applied to the SKU Maintenance rate.

Methodology Notes

Metric	How It Is Calculated
ZONE rate (per 10k)	Zone/pallet error count ÷ total placement volume (units palletized + totes zone-assigned) × 10,000.
SPLIT rate (per 100k)	Split-move error count ÷ total split-case units touched × 100,000. Uses 100k because split-case volume is roughly an order of magnitude larger than placement volume.
SKU rate (per 1k)	SKU Maintenance error count ÷ total Capture Item Attribute actions × 1,000. Uses 1k because Capture volume runs smaller than both placement and split-case volume — this keeps displayed rates in a readable 0–15-ish range rather than the hundreds.
STR score	Average of VOL% and ACC%. Each is a percentile rank from 0–100 relative to the current roster.
ACC%	Average of three percentile ranks — zone accuracy, split accuracy, and SKU accuracy — each weighted equally. Previously a two-way average of zone and split only.
C-Shift vol scaling	C-Shift processors work 36 hours per week (3 days) vs 40 hours (4 days) for A and B. For volume percentile ranking only, C-Shift raw figures are multiplied by 40/36 (≈1.11). Error rates are not adjusted — they are already volume-normalized by their denominators.
Trend arrows	Each processor's error rate is calculated for the most recently completed month and for the month immediately before it. The trend arrow reflects the direction of change between those two months. This is a rolling one-month comparison, not a fixed half-year split.
Shift assignment	A processor's SH badge reflects whichever month — among all months with data — is chronologically latest. This ensures mid-period shift changes are shown correctly rather than defaulting to the earliest recorded shift.
Data window	Dynamic — determined by whichever months have production and/or error records loaded into the workbooks. Not fixed to a specific range. As new months are added, both the roster and the trend comparison update automatically.
